Bank Agent Assist — Google AI Builder Cup 2026

Oct 9, 2026 · @Arshi

Problem Statement Category

BFSI — Intelligent Risk, Fraud & Financial Experiences

Build an AI-powered solution that addresses meaningful challenges across banking, financial services, insurance, or related industries. Solutions may focus on detecting and mitigating fraud or risk, automating complex processes, improving customer interactions, or delivering more personalized and informed financial experiences.

The Problem

Bank customer support agents handle hundreds of calls daily — disputes, fraud alerts, failed transactions, billing queries. But they work blind, toggling between 4–6 legacy systems to piece together customer history, manually typing resolutions, and relying on memory for compliance scripts. The result: average handle times of 6–10 minutes per call, frustrated customers, burnt-out agents, and high operational costs for banks.

Target User

The target user for our solution is the bank customer support agent, not the end customer.

Current Painful Journey

Here's the typical process an agent goes through today to handle a customer dispute call, highlighting the pain points:

1. **Receive dispute call** — Customer calls in frustrated about an unrecognized charge
2. **Toggle between systems** — Agent has to log into 4–6 different tools (CRM, billing system, transaction database, case management) to investigate
3. **Manually reconstruct history** — Agent must piece together customer profile, recent charges, dispute filing status by searching & scanning across systems
4. **Place customer on hold** — Agent has to put the angry customer on hold several times to research the case

5. **Rely on memory for process** — Agent tries to recall the right sequence of steps to initiate a dispute based on past training
6. **Manually fill out forms** — Agent must re-type customer info into dispute forms, no pre-fill
7. **Verbally relay next steps** — Agent has to manually explain the resolution process to the customer, reading from a script
8. **Wrap-up work** — Agent spends 5–10 minutes post-call updating systems & logging notes

Result: Frustrated customer, stressed agent, long handle times, high cost for the bank

The Solution

Bank Agent Assist is an AI-powered co-pilot for bank customer support agents. When a Customer calls, the assistant instantly surfaces everything the agent needs — customer profile, recent transactions, flagged risks, and past interactions — in one unified view.

It listens to the live conversation, detects the issue type in real time, and suggests the best resolution with one-click actions. Agents no longer search, type, or guess — they just resolve.

Core Features

1. **Smart Cardholder Briefing** — Instant AI summary of the caller's profile, recent transactions, and risk flags the moment the call connects
2. **Live Intent Detection** — Real-time analysis of the conversation to classify the issue (dispute, fraud, limit request, etc.) and surface relevant context
3. **AI-Suggested Resolutions** — Actionable response cards with recommended next steps, pre-filled forms, and compliance-safe scripts
4. **One-Click Actions** — Agents resolve issues (block card, initiate dispute, waive fee) directly from the dashboard without switching systems

Built on Google Cloud

Need	Google Cloud Tool
AI / LLM for reasoning & summaries	Gemini API (Vertex AI)
Real-time intent detection	Dialogflow CX
customer transaction data	BigQuery

Need	Google Cloud Tool
Scalable backend deployment	Cloud Run
Frontend hosting & authentication	Firebase

Impact

Metric	Current State	With Bank Agent Assist
Avg. handle time per call	6–10 minutes	Under 2 minutes
Systems toggled per call	4–6	1 unified view
Agent onboarding time	Weeks	Days
Customer satisfaction (NPS)	Low	Significantly higher
Compliance risk	High (manual)	Low (AI-guided scripts)

Why This Wins

- **Real problem, real scale** — Every bank globally runs support operations; this is a universal pain point that judges from Google Cloud and the BFSI industry will immediately recognise
- **AI does the heavy lifting** — Gemini's reasoning and summarisation capability is core to the solution, not a feature add-on
- **Measurable ROI** — Banks can calculate cost savings immediately: fewer agents, shorter calls, lower error rates
- **Built by people who know banking** — The team brings direct fintech experience from building card products used by millions across 7 countries
- **Operator-side differentiation** — Most hackathon teams build Customer-facing apps; this targets the agent and bank operator, making it stand out from the crowd
